Education

Carleton University

September 2023 – Expected April 2027

Bachelor of Information Technology (B.IT.), Network Technology, 4th Year

Ottawa, Ontario

Relevant Coursework: DevOps, Real-time Systems, Network Management and ML, IP Architecture and Solutions, Desktop and Server Environments II, Transmission Systems, Computer Architecture, Wireless Networks, Data Structures, Databases

Extracurriculars: Carleton Muslim Students' Association (MSA) - Participated in Islamic Awareness Week (IAW)

Technical Skills

Languages & Frameworks: Python, Java, C, C++, MATLAB, LC3 Assembly, TypeScript, React, FastAPI

Network Operating Systems: Cisco IOS CLI, Juniper Junos, Aruba CLI

Automation & DevOps: Ansible Automation Platform (AAP), Docker, Git, GitLab

Developer Tools & Databases: VS Code, PyCharm, Wireshark, PuTTY, MobaXterm, VMware Fusion, Visio, MySQL,

Platforms & Monitoring: Zabbix, NNMI, Elasticsearch, HashiCorp Vault, DocuSeal, Lighthouse

Networking Protocols: TCP/IP, STP, ARP, RIP, BGP, OSPFv2/v3, EIGRP, MPLS

Experience

Shared Services Canada – Infrastructure Dev Intern

May 2026 – Present

Ottawa, Ontario

- Automated **Azure-compatible SSL/TLS certificate request generation** using **Ansible** and **OpenSSL**, creating a reusable role-based workflow that generated CSRs, private keys, and standardized OpenSSL configurations for SSC NAI environments, reducing manual certificate setup time from **20–30 minutes to under 2 minutes** per request.
- Engineered and validated a **multi-hop SSH/Ansible deployment workflow** across devHost, jump hosts, and **Azure GitLab infrastructure** (git02), enabling **centralized certificate automation** and secure repository distribution for SWLINUX operations while standardizing inventory, SSH proxy routing, and environment configuration for future production deployments.
- Migrated an internal n8n automation platform from an Azure development VM to a pre-production environment, resolving SSL, reverse-proxy, and network routing issues to restore secure external HTTPS access, **reducing deployment time from several hours to 20–30 minutes** through a repeatable process.

Shared Services Canada – NetDevOps Intern

April 2025 – April 2026

Ottawa, Ontario

- Led a **GitLab** account audit using the **GitLab API**, identifying **132 inactive users** and enabling a deactivation strategy that reduced licensing costs while adhering to platform constraints.
- Developed and maintained a suite of **Ansible playbooks** that continuously polled **75+ network devices** for health metrics, triggering automated alerts for timely incident detection and resolution.
- Integrated **Zabbix** real-time monitoring into CI/CD pipelines across **3 environment tiers**, eliminating all manual health checks and reducing mean incident response time.
- Assessed **Ansible Forms** as a self-service automation interface for cross-team workflows, delivering a scoped implementation roadmap that was accepted by senior engineers for rollout.
- Audited and refactored **20+ Ansible playbooks** and automated **15 network monitoring jobs**, eliminating **30%** of redundant execution steps and improving reliability of automated network checks.
- Reworked the **Lighthouse** audit pipeline to validate **6 asset attributes** per device (IP, DNS, name, model, serial, ownership), improving inventory accuracy across **500+ records** and reducing audit discrepancies.

Shared Services Canada – LAN Operations Technician

May 2024 – April 2025

Ottawa, Ontario

- Upgraded firmware on **50+ Juniper EX-4300 P** and MP switches via Linux scripting, resolving multiple known vulnerabilities and aligning all devices to current security baselines.
- Designed Visio topology diagrams for **10+ NCR sites** documenting subnet structures and physical layouts, formally adopted as the primary reference for field technicians during incident response.
- Consolidated fragmented site documentation – network configurations, topologies, and switch inventory for **10+ NCR sites** – into a centralized reference system, reducing ops team lookup time by **40%** and enabling faster incident response.

Projects

BlackBoxNet | *FastAPI, React, TypeScript, PostgreSQL, Docker* | github.com/dkabduli/BlackBoxNet

- Architected a Git-backed network state replay platform to reduce troubleshooting time from **hours to minutes**. Engineered a correlation engine and semantic diff viewer to automatically link configuration changes to outages.
